11.Product Category Analysis

1: Funnel Chart

Code:

```
category <- c("Electronics", "Appliances", "Clothing")
sales <- c(50000, 40000, 35000)
barplot(sales,
        names.arg = category,
        horiz = TRUE,
        col = c("skyblue", "orange", "lightgreen"),
        main = "Sales Conversion Funnel by Product Category",
        xlab = "Sales ($)",
        xlim = c(0, 60000))
```

Output:

2: Table

Code:

```
product <- data.frame(
  Category = c("Electronics", "Clothing", "Appliances"),
  Sales = c(50000, 35000, 40000)
)
```

```
print(product)
```

Output:

```
+      horiz = TRUE,
+      col = c("skyblue", "orange", "lightgreen"),
+      main = "Sales Conversion Funnel by Product Category",
+      xlab = "Sales ($)",
+      xlim = c(0, 60000))
> # Product Category Data
> product <- data.frame(
+   Category = c("Electronics", "Clothing", "Appliances"),
+   Sales = c(50000, 35000, 40000)
+ )
>
> # Display Table
> print(product)
  Category Sales
1 Electronics 50000
2  Clothing 35000
3 Appliances 40000
> |
```

```
R C:\Users\uppal\OneDrive\Documents\lab experiments-2.R - R Editor

      labels=category,
      main="Sales Conversion Funnel by Product Category")

# Product Category Sales Data
category <- c("Electronics", "Appliances", "Clothing")
sales <- c(50000, 40000, 35000)

Set13. Dataset: Geographic Data

1: Map Chart (Using Scatter Plot as City Map)

Code:

```
# Geographic Data
city <- c("City A", "City B", "City C")
Population <- c(500000, 700000, 600000)
Temperature <- c(75, 68, 80)
Elevation <- c(1000, 800, 1200)
# Sample Coordinates
Longitude <- c(78.5, 77.2, 79.0)
Latitude <- c(17.4, 28.6, 13.1)
plot(Longitude, Latitude,
      pch=19,
      col="blue",
      cex=2,
      xlab="Longitude",
      ylab="Latitude",
      main="Geographic Distribution of Cities")
text(Longitude, Latitude,
      labels=city,
      pos=3)
```

Output:

2: Scatter Plot

Code:

```
plot(Population,
      Temperature,
      pch=19,
      col="red",
      main="Population vs Average Temperature",
      xlab="Population",
      ylab="Average Temperature (°F)")
```

Output:

3: Table

Code:

```
geo <- data.frame(  
  City=c("City A","City B","City C"),  
  Population=c(500000,700000,600000),  
  AvgTemperature=c(75,68,80),  
  Elevation=c(1000,800,1200)  
)  
print(geo)
```

Output:

The screenshot shows two windows from an R environment. The 'R Console' window on the left displays the execution of R code. The code defines a data frame 'geo' with columns for City, Population, AvgTemperature, and Elevation. It then prints the data frame, resulting in a table with 3 rows and 4 columns. The 'Untitled - R Editor' window on the right shows the code for a scatter plot. The plot has 'Population' on the x-axis and 'Average Temperature (°F)' on the y-axis. It uses red points with a size of 19. The plot title is 'Population vs Average Temperature'. The main title of the R Graphics window is 'Geographic Distribution of Cities'.

```
> text(Longitude, Latitude,  
+       labels=city,  
+       pos=3)  
> # Scatter Plot
